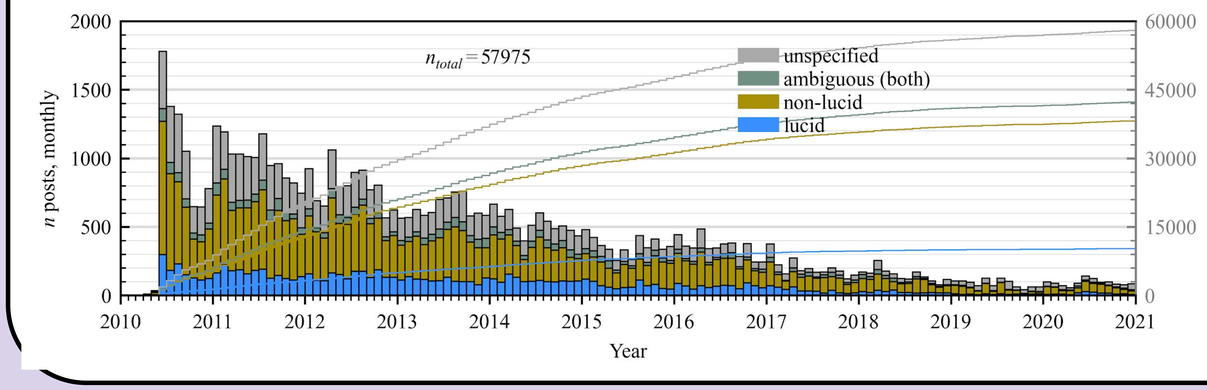
Problem and Solution

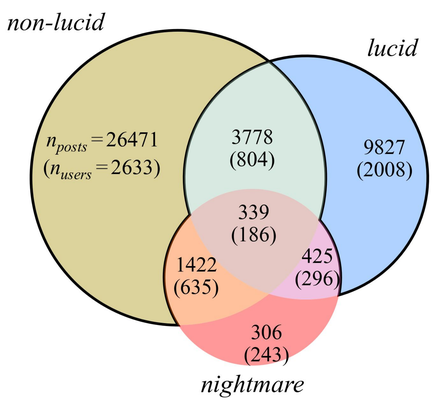
We don't have many lucid dreams on file. They're so hard to collect in the laboratory!

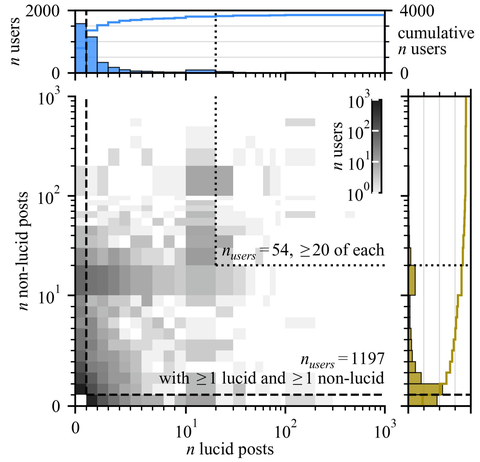
50k public dream reports were extracted from an online forum that authors identified as lucid or non-lucid and validated the accuracy of the lucidity labels.

A decade of dream reports with author-defined lucidity labels!

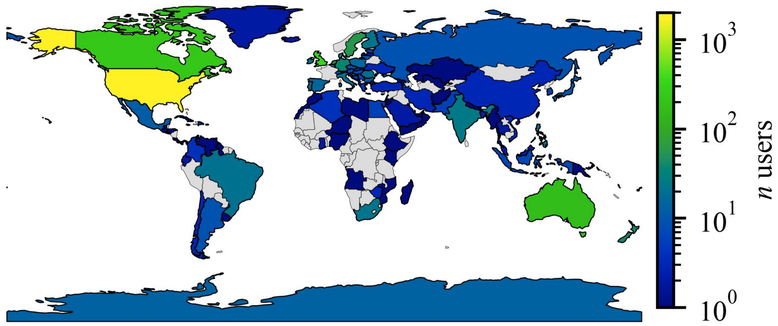


A ton of dream reports! Multiple dreams per author!!

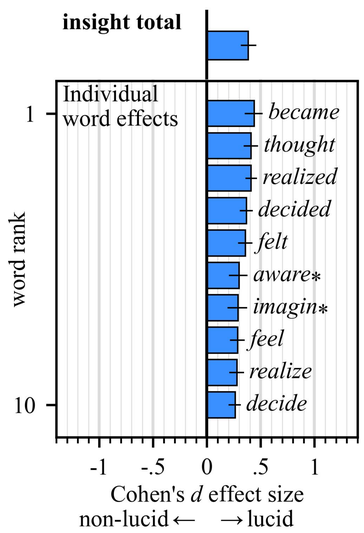


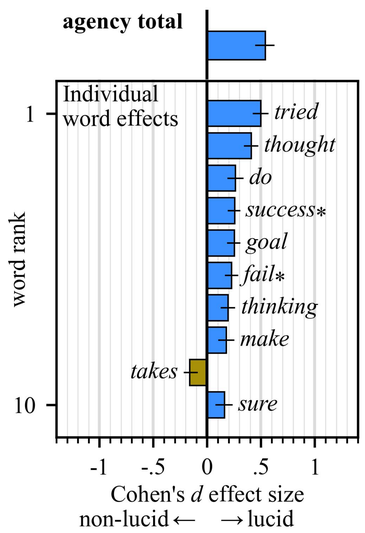


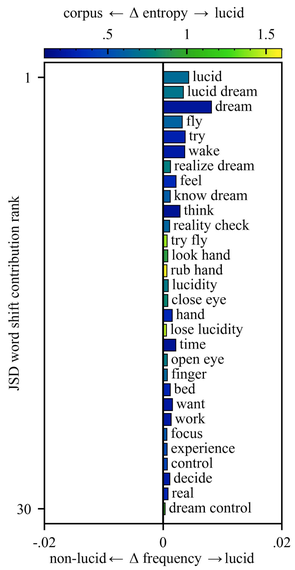
Dream reports from all over the world!



Lucid labels have criterion validity! Use them for novel discovery!!







What could *you* do with this dataset??

Increase your power with a within-subjects design!
Use this huge sample size to build a model of dream language!
Make a lucidity decoder that can predict whether a dream is lucid or not!
There are also nightmare labels! Wow!!
